ACKNOWLEDGEMENT

Praise be to the presence of God, for it is by His blessings and mercy that the author was able to complete this project successfully. Throughout the process of preparing and writing this Project Proposal, the author received abundant guidance and support, allowing its timely completion.

The author would like to express sincere gratitude to **Ts. Dr. Husna Sarirah Husin**, the academic facilitator, for her invaluable assistance and guidance throughout this journey. Her insightful advice, encouragement, and ideas played a significant role in shaping and completing this proposal.

Special thanks are also extended to the author's family and friends, whose continuous support and encouragement were instrumental during the development of this project.

This Project Proposal has not only been an academic task but also a meaningful learning journey. The author has gained many new insights and experiences, and is committed to applying this knowledge for the benefit of others in the future.

Thank you.

ABSTRACT

In the digital era, florist businesses still largely depend on manual processes such as phone calls and WhatsApp messaging, leading to inefficient order management and inaccurate inventory tracking. This project proposes a web-based Florist Management System that streamlines bouquet inventory, order processing, and customer management for both customers and admins. The system is developed using PHP Laravel as the backend framework, MySQL as the database, and Bootstrap 5 for the frontend interface. Beyond standard management functions, it introduces two innovative features: a Smart Bouquet Recommendation Wizard and a Smart Reminder System for occasion-based notifications. This system is expected to reduce manual effort, minimise order errors, and improve customer satisfaction for florist businesses transitioning into the digital era.

Keywords: Florist Management System, Web-Based Application, Smart Recommendation System, Automated Reminder System, Inventory Management, E-Commerce, Agile Methodology.

Chapter 1: Introduction

The advancement of internet technology has significantly transformed the way businesses operate and interact with their customers. Many industries have embraced digital solutions to improve efficiency, reduce manual workload, and enhance customer experience. The florist industry, however, remains largely dependent on traditional and manual processes, creating inefficiencies that affect both business owners and their customers.

This project presents the development of a web-based Florist Management System — a digital platform designed to help florist businesses manage their daily operations, including bouquet inventory, customer orders, and customer relationship management. Beyond standard management features, the system incorporates two innovative capabilities: a Smart Reminder System that automatically notifies customers about upcoming occasions, and a Smart Bouquet Recommendation Wizard that guides customers in selecting the most suitable bouquet based on their preferences.

By leveraging modern web technologies, this system aims to bring florist businesses into the digital era, reducing manual effort while delivering a more personalised and convenient experience for customers.

1.1 Problem Statement

Florist businesses that rely on manual processes face several operational challenges that limit their growth and service quality. Based on observation and analysis of traditional florist operations, the following problems have been identified:

1. Manual order management is inefficient. Most florist businesses record customer orders through phone calls, handwritten notes, or basic messaging applications such as WhatsApp. This approach is prone to human error, makes it difficult to track order status, and creates confusion during peak seasons such as Valentine's Day and Mother's Day when order volumes increase significantly.
2. Inventory management lacks accuracy. Without a centralised system, business owners struggle to monitor bouquet stock levels in real time. This often leads to overselling, last-minute stockouts, or over-ordering, all of which directly affect customer satisfaction and business profitability.

3. Customer retention is poorly managed. Florist businesses rarely follow up with past customers about recurring occasions such as anniversaries or birthdays. As a result, many repeat purchase opportunities are lost simply because customers are not reminded at the right time.
4. Customers lack guidance when choosing bouquets. Many customers, especially first-time buyers, are unsure which bouquet to purchase. Without any recommendation system, they may leave the website without completing a purchase, reducing overall sales conversion.

1.2 Objectives

This project aims to develop a system where customers can easily browse and purchase bouquets online, for the business owner to efficiently manage inventory and customer orders, and for the system administrator to maintain the application and keep it aligned with current technology standards. The specific objectives are as follows:

1. To design and develop a web-based Florist Management System that enables business owners to manage bouquet inventory, customer records, and order processing through a centralised digital platform.
2. To implement a Customer Management module that allows customers to register, manage their profiles, and view their complete order history.
3. To develop an Order Management module that supports the full order lifecycle, including order creation, status tracking, payment status monitoring, and order history.
4. To build an Admin Dashboard that provides business owners with real-time insights into sales performance, customer statistics, and best-selling products.
5. To design and implement a Smart Reminder System that automatically sends personalised notifications to customers via email before upcoming occasions such as birthdays, anniversaries, and recurring purchase anniversaries.
6. To develop a Smart Bouquet Recommendation Wizard that guides customers through a series of preference-based questions and recommends the most suitable bouquets from the available catalogue.

1.3 System Scope

This project focuses on the development of a web-based system intended for use by a single florist business. The system caters to two main user levels: the Admin and the Customer. Customers will be able to access the system to browse available bouquets, place orders, and track their order status at any time. For the business owner, the system primarily handles bouquet inventory management, order fulfilment, and customer record keeping. The system administrator will be responsible for maintaining the application and ensuring it remains up to date with current technology requirements.

The system covers the following modules: customer registration and profile management, bouquet and category management, order and payment status tracking, admin dashboard with sales reporting, Smart Reminder System for occasion-based notifications, and Smart Bouquet Recommendation Wizard for personalised product suggestions.

The following areas are outside the scope of this project: online payment gateway integration, mobile application development, multi-branch support, and real-time delivery tracking.

1.4 Target User

This system is designed for individuals involved in the daily operations and usage of a florist business, whether managing the shop or purchasing its products. It caters to three main groups of users. The **Business Owner/Admin** relies on the system to manage bouquet inventory, track customer orders, monitor payment status, and gain insights into sales performance through the admin dashboard, reducing the manual effort previously spent on phone calls, handwritten notes, and messaging apps. The **System Administrator** is responsible for maintaining the application, ensuring the system remains functional, secure, and up to date with current technology standards. Meanwhile, **Customers** — including both first-time and repeat buyers — use the system to browse available bouquets, place orders, track order status, and receive personalised reminders for upcoming occasions such as birthdays and anniversaries. The system is intended to be simple and intuitive, allowing customers of varying technical backgrounds to easily search, select, and purchase bouquets, while also benefiting from guided recommendations through the Smart Bouquet Recommendation Wizard when unsure what to choose.

1.5 Methodology

To achieve the objectives of this project, a systematic development process has been followed. The process begins with the identification of the research topic related to florist management systems, where studies were carried out to gather sufficient background information. Following this, requirements were collected through analysis of existing manual florist operations to identify key functional needs. Based on the gathered requirements, the system was designed and developed using PHP Laravel as the backend framework, MySQL as the database, and Bootstrap 5 for the frontend interface. The development follows an Agile-based approach, allowing for iterative improvements throughout the project lifecycle.

1.6 Project Timeline

Figure 1.1 shows the project timeline of this system.

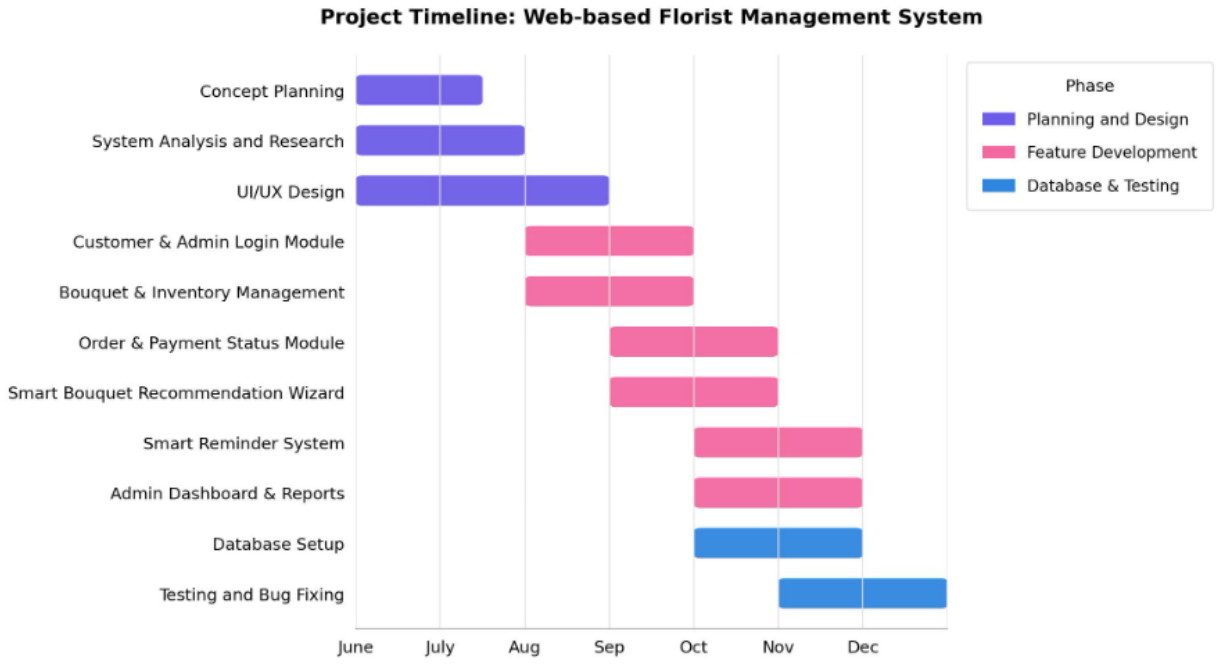

Figure 1.1 project timeline of this system

Planning and Design Phase

A. **Concept Planning**: Starting in early June, this phase aims to define the vision, target users, and core features of the Florist Management System, including the Smart Reminder System and Smart Bouquet Recommendation Wizard.
B. **System Analysis and Research**: Running from June, this involves analyzing the needs of florist business owners and customers, and researching suitable tools and technologies, including PHP Laravel, MySQL, and Bootstrap 5.
C. **UI/UX Design**: Started in June to design a user-friendly interface for both the customer-facing site and the admin dashboard, continuing through August.

Planning and Design + Feature Development

A. **Concept Planning**: Completed by mid-July.
B. **System Analysis and Research:** Completed by the end of July.
C. **UI/UX Design:** Continues running in parallel to refine both customer and admin interface designs, concluding at the end of August.
D. **Customer & Admin Login Module**: Development begins in August, covering registration and authentication for both customers and business owners/admins.
E. **Bouquet & Inventory Management:** Development begins in August, allowing admins to manage bouquet stock, categories, and product listings.

Feature Development

A. **Customer & Admin Login Module:** Development continues through September.
B. **Bouquet & Inventory Management**: Development continues through September.
C. **Order & Payment Status Module**: Development begins in September, supporting order creation, status tracking, and payment status monitoring, running through October.
D. **Smart Bouquet Recommendation Wizard**: Development begins in September, building the preference-based questionnaire that guides customers to suitable bouquets, running through October.
E. **Smart Reminder System**: Development begins in October, implementing automated email notifications for upcoming occasions such as birthdays and anniversaries, running through November.

F. **Admin Dashboard & Reports:** Development begins in October, providing sales insights, customer statistics, and best-selling product data, running through November.

Database & Testing Phase

A. **Database Setup:** Runs from October to November, finalizing the MySQL database structure to support all modules.
B. **Testing and Bug Fixing:** Begins in November and continues through December, covering functional testing, bug resolution, and final refinements before submission.

Chapter 2: Literature Review

2.1 Introduction

The development of web-based management systems has grown significantly over the past decade, driven by the increasing need for businesses to digitalise their operations and improve service delivery. In the context of small and medium enterprises (SMEs), particularly those in the retail and service sectors, web-based systems have proven to be an effective solution for managing daily business activities such as inventory tracking, order processing, and customer relationship management .

The florist industry represents one of the many traditional businesses that still heavily relies on manual and informal methods of operation. Studies in developing countries, including Indonesia and Malaysia, have shown that small retail businesses often face challenges related to unstructured order management, poor inventory visibility, and limited customer engagement strategies. These challenges are consistent with the problems identified in this project, which further justifies the need for a dedicated digital management system for florist businesses.

The emergence of recommendation systems and automated notification features in e-commerce platforms has also been widely discussed in recent literature. Rule-based recommendation approaches, which filter products based on user-defined preferences, have been found to be practical and effective for small-scale e-commerce applications where sufficient historical data for machine learning models may not yet be available. Similarly, automated reminder systems built on scheduled task mechanisms have demonstrated positive effects on customer retention and repeat purchase behaviour in online retail environments.

This chapter reviews three existing systems that are similar in nature to the proposed Florist Management System, analyses their features and limitations, and presents a comparative summary to justify the design decisions made in this project.

2.2 Review on the Existing System

2.2.1 Existing System 1

The first existing system reviewed is **Talula Florist**, an online florist based in Depok, West Java, offering bouquets, vase arrangements, blooming boxes and baskets in both fresh and preserved flower variants.

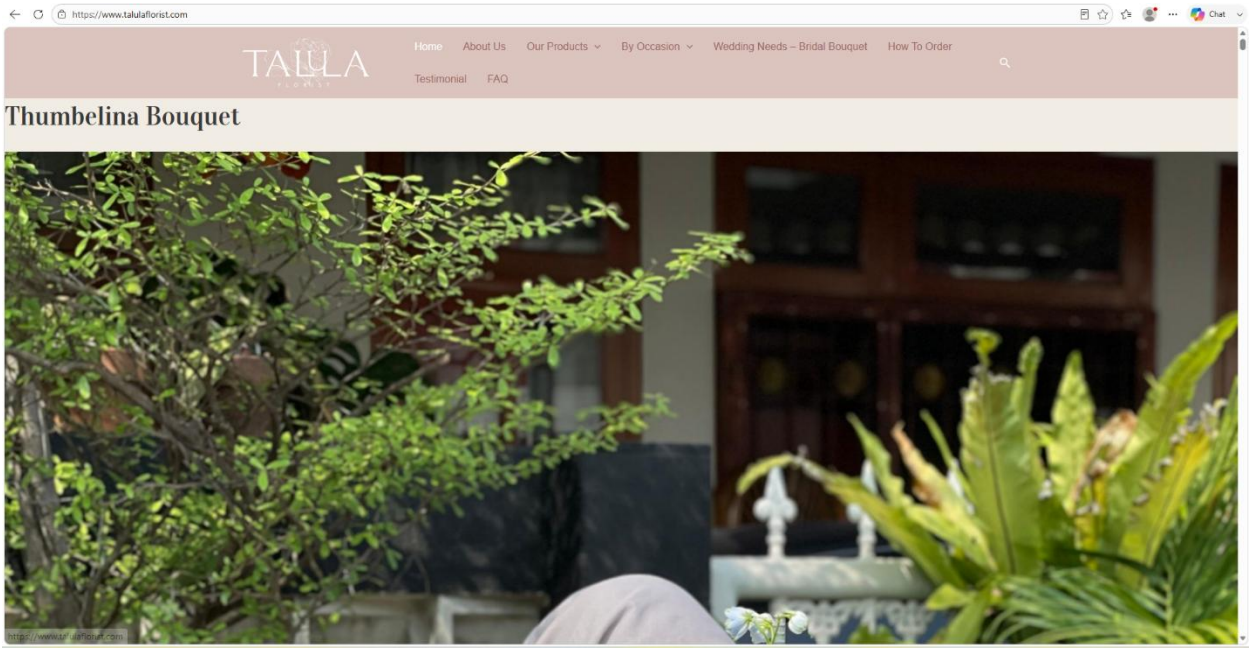

Figure 2.1 Homepage of Talula Florist

Figure 2.1 is the homepage view of Talula Florist. There is a scrolling image gallery of featured bouquets and seasonal promotions. If you scroll down, you will see the "2 in 1 Package: Gift & Flower" offer, same-day delivery information, and the brand's story behind the Talula logo.

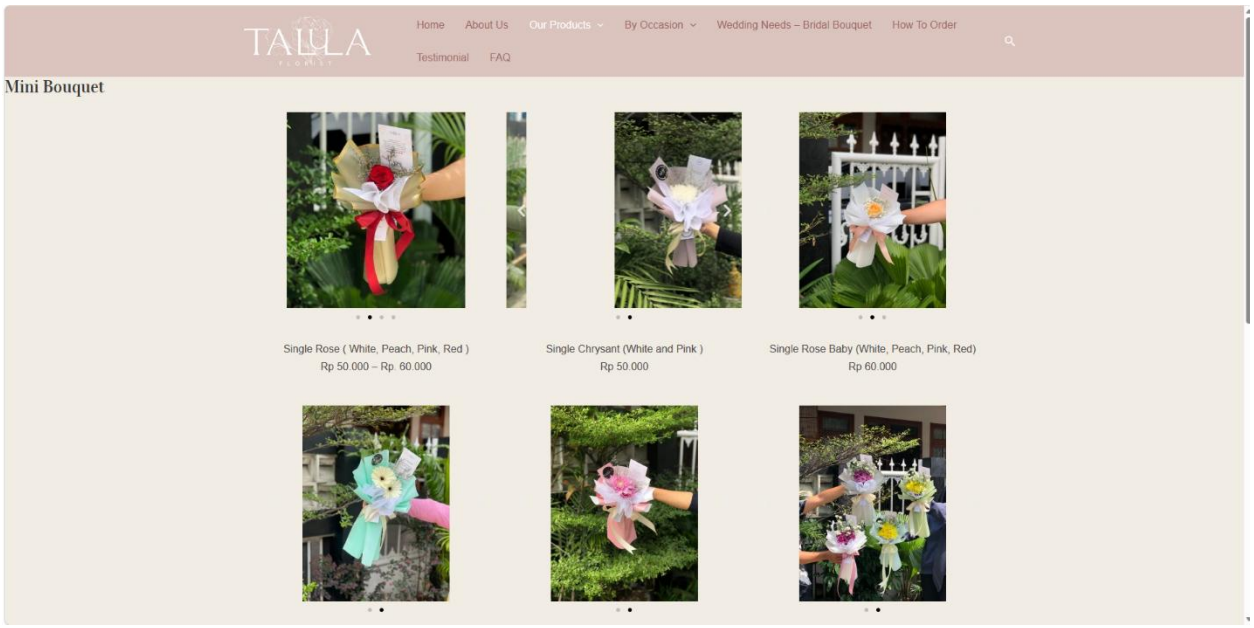

Figure 2.2 Catalog of Talula Florist

Figure 2.2 is a view of the product catalogue in Talula Florist. There are various bouquet categories such as Mini, Small, Medium, and Large Bouquet, as well as an "By Occasion" section for birthdays, anniversaries, and graduations.

Advantages:

a. **Extensive Product Categorisation** — the "By Occasion" and "By Types" navigation makes it easy for customers to narrow down choices based on their specific need.
b**. Same-Day Delivery** — the site advertises same-day flower delivery, which builds customer confidence for urgent orders.
c. Brand Identity — the site includes a detailed brand story (the meaning behind the logo and name), which strengthens emotional connection with customers.

Disadvantages:

a. **No Visible Real-Time Order Tracking** — customers cannot log in to check the status of a placed order; communication after checkout appears to rely on WhatsApp rather than an account dashboard.
b**. No Recommendation Support** — first-time buyers unsure which bouquet suits their occasion must browse manually through many categories without any guided suggestion tool.
c. **No Loyalty or Reminder Feature** — there is no mechanism to remind repeat customers of upcoming occasions such as anniversaries or birthdays.

2.2.2 Existing System 2

The second existing system reviewed is **Berkah Florist (Sahla Florist) Cileungsi**, a florist service site targeting the Cileungsi area, specialising in standing flowers, flower boards (papan bunga), wreaths, and bouquets for weddings, condolences, and celebratory events.

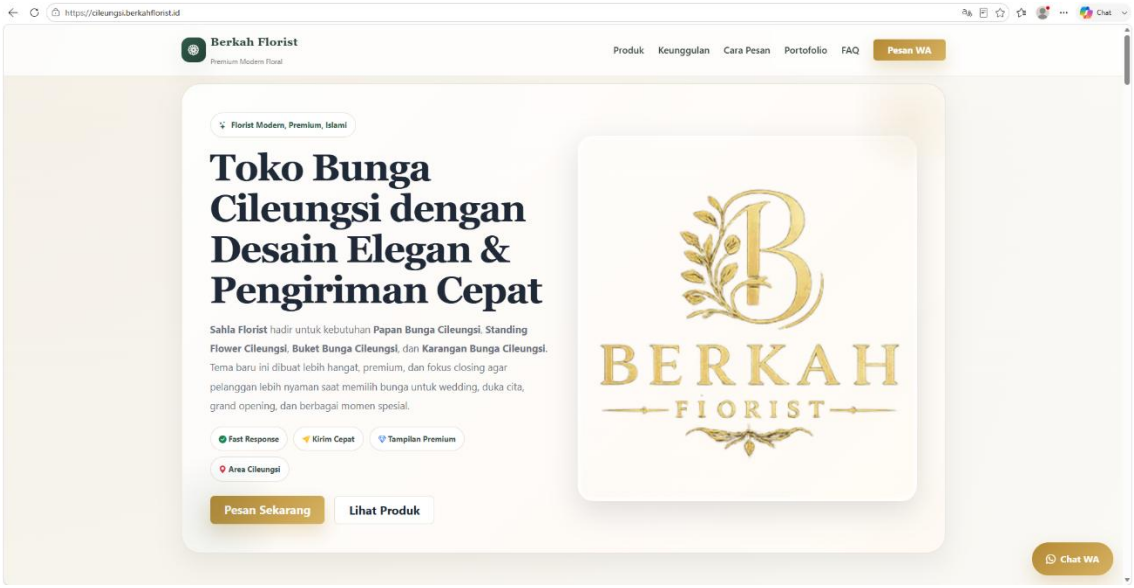

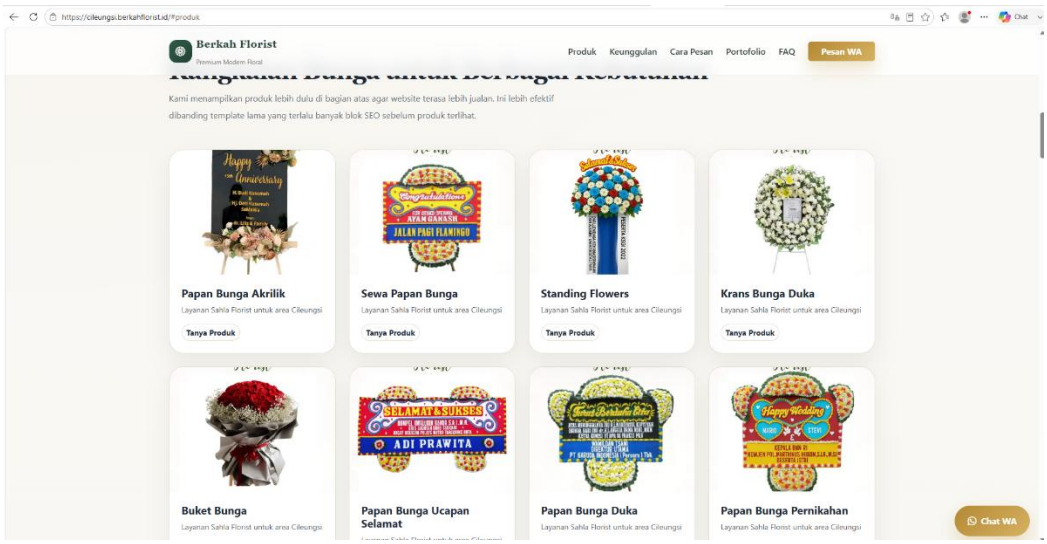

Figure 2.3 Homepage of Berkah Florist Cileungsi

Figure 2.3 is the homepage view of Berkah Florist Cileungsi. There is a hero banner promoting fast response and same-day delivery. If you scroll down, you will see the product showcase

section displayed right after the banner, followed by the company's advantages and ordering step

Figure 2.4 Product Catalogue of Berkah Florist Cileungsi

Figure 2.4 is a view of the product catalogue in Berkah Florist Cileungsi. There are various product cards such as Papan Bunga Akrilik, Standing Flowers, Krans Bunga Duka, and Buket Bunga, each with a "Tanya Produk" button linking to WhatsApp.Figure 2.5 is a view of the portfolio section in Berkah Florist Cileungsi. There is a gallery showcasing completed work such as standing flowers, papan bunga, and buket arrangements, along with customer testimonials highlighting fast processing and premium design quality.

Figure 2.5 is a View of FAQ Section of Berkah Florist Cileungsi

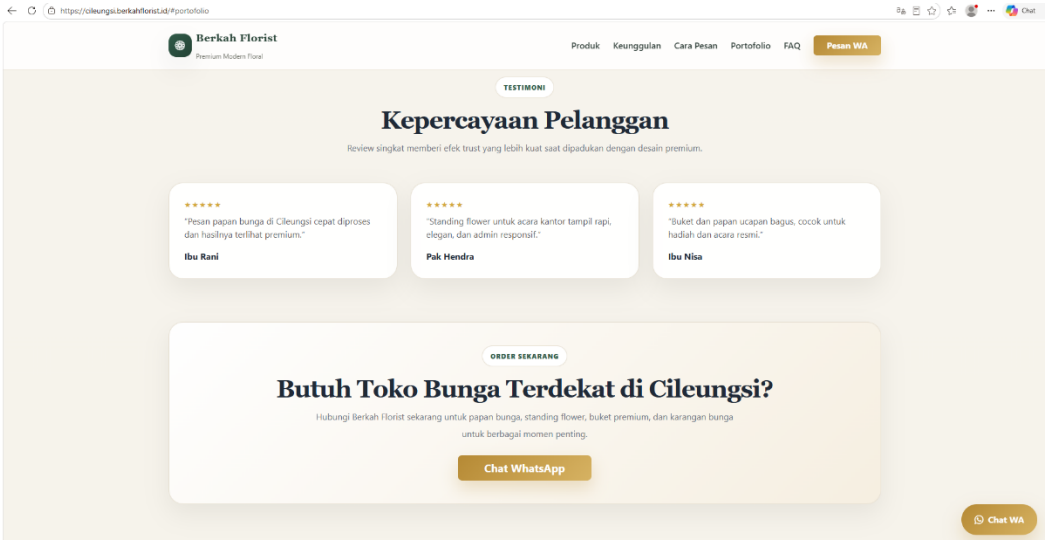

Figure 2.5 is a view of the FAQ section in Berkah Florist Cileungsi. There is a list of frequently asked questions covering topics such as custom design requests, same-day ordering, pricing by flower-board size, and delivery coverage area, each answered directly on the page.

Advantages:

a. **Fast Order Initiation** : every product links directly to a pre-filled WhatsApp message, reducing friction for customers who want to inquire immediately.
b. **Clear Ordering Steps** : the site outlines a simple four-step process (choose product, send details, processing, delivery) that sets clear expectations for the customer.
c. **Wide Service Coverage** : the site lists many nearby service areas, showing a broad delivery reach.

Disadvantages:

a. **No Online Catalogue Pricing or Cart** : prices are not listed per product; customers must ask manually via WhatsApp for every item, which slows down the ordering process compared to a true e-commerce flow.

b. **No Customer Account or Order History** : the system is essentially a static catalogue with a WhatsApp redirect, offering no login, no order history, and no way to track past purchases. c. **Heavy Reliance on Manual Communication** : since all transactions ultimately depend on WhatsApp chat, the business still faces the same manual order-tracking risks (miscommunication, no centralised record) described in Section 1.1.

2.2.3 Existing System 3

The third existing system reviewed is **Desflo**, an online florist based in Semanan, Kalideres, Jakarta, founded in 2021 by two young entrepreneurs, offering bouquets, bloom boxes, arrangements, wedding flowers, imported cut flowers (Ecuador rose, Tulip, Ranunculus, Peony, and others), and flower subscriptions.

Figure 2.6 Homepage of Desflo

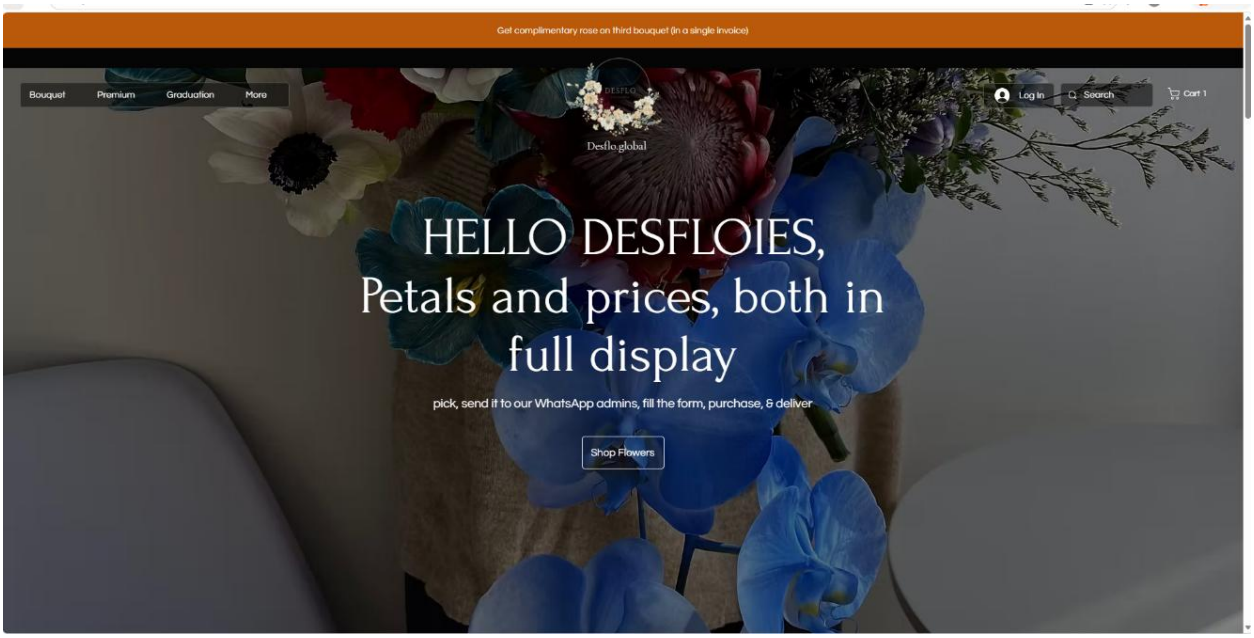

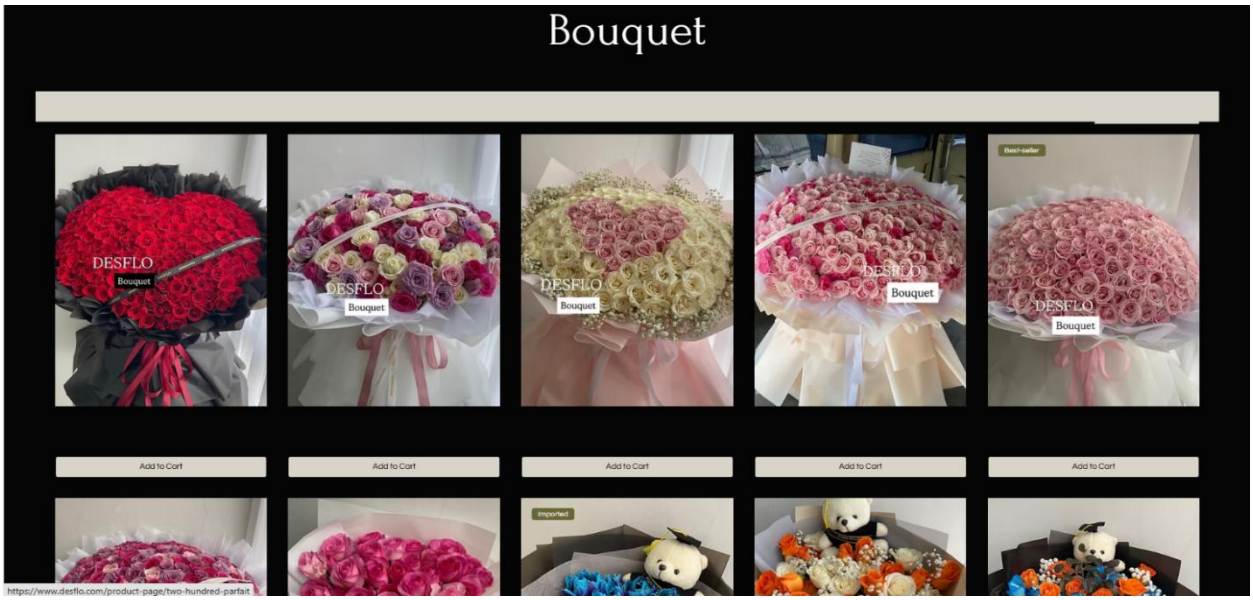

Figure 2.6 is the homepage view of Desflo. There is a hero banner with the tagline "Petals and prices, both in full display," followed by a client review section featuring testimonials from beauty pageant titleholders, a catalogue preview linking to Bouquet, Bloom Box, and Subscription categories, and a brand story section describing the founders' journey since 2021.

Figure 2.7 is a view of the Shop All page in Desflo. There is a filterable product grid with a price-range slider, and each bouquet — such as Heart of Roses, Cotton Heart, and Whimsy — is

displayed with its own price in Rupiah and an "Add to Cart" button, allowing customers to build a

cart directly on the site.

Advantages:

a. Genuine Online Cart and Checkout : unlike the previous two systems, Desflo has an actual shopping cart with a checkout page, rather than redirecting every inquiry to WhatsApp.
b. Transparent Per-Item Pricing : every product lists its exact price, including visible discounts on sale items (e.g., regular vs. sale price).
c. Social Proof : the homepage's client review section, featuring recognisable titleholders, builds credibility and trust for new visitors.

Disadvantages:

a. No Integrated Online Payment Gateway : despite having a cart and checkout flow, the site does not process payment directly; customers must manually transfer payment and call to confirm before the order is accepted ("No payment = No order, miss call once, upon transfer"), which reintroduces a manual verification step similar to the WhatsApp-based systems.
b. No Recommendation Support : customers must browse or filter by price manually, with no guided suggestion tool for those unsure what to choose.
c. No Occasion Reminder Feature : there is no mechanism to notify repeat customers ahead of recurring occasions such as anniversaries or birthdays.

2.2.4 Comparison with the Florist Management System

Table 1 presents a comparison between the three existing systems and the proposed Florist Management System.

Feature	**Talula Florist**	**Berkah Florist Cileungsi**	**Desflo**	**Florist Management System (Proposed)**
Interface UI/UX	Strong	Medium	Strong	Strong
Online Cart/Checkout (in-system)	No (WhatsApp-based)	No (WhatsApp-based)	Yes (cart, no payment gateway)	Yes
Integrated Online Payment	No	No	No (manual transfer + call)	Payment status tracking only
Customer Login & Order History	No	No	Login available, unclear order history	Yes
Product Recommendation	No	No	No	Yes (Smart Bouquet Recommendation Wizard)
Occasion Reminders	No	No	No	Yes (Smart Reminder System)
Admin Sales Dashboard	Not visible to customer	Not visible to customer	Not visible to customer	Yes
Visible Pricing per Item	Yes	No	Yes	Yes

Table 2.1 Comparison Between system

As shown in Table 2.1, all three existing systems fall short in at least one key area compared to the proposed system. Talula Florist and Berkah Florist Cileungsi rely entirely on WhatsApp for ordering, while Desflo goes a step further with a genuine cart and checkout flow but still lacks an integrated payment gateway, requiring manual bank transfer confirmation. None of the three systems offer customers a personalised way to choose a bouquet, nor do any of them remind past customers about upcoming occasions — both gaps directly correspond to the problems identified in Section 1.1. The proposed Florist Management System addresses these gaps by combining a centralised order and inventory platform with two guided digital features, the Smart Bouquet Recommendation Wizard and the Smart Reminder System, while still retaining an admin dashboard for real-time sales and customer insight that none of the three reviewed systems expose.

2.3 Review of Core Technologies & Frameworks (Tech Stack Justification)

Selecting an appropriate technology stack is a critical design decision that affects development speed, maintainability, and long-term scalability of the system. Rather than simply defining each technology, this section compares the selected tools against their common alternatives to justify why they best fit the requirements of the Florist Management System.

a. Backend Framework: PHP Laravel vs. CodeIgniter vs. Node.js (Express)

Criteria	Laravel (PHP)	CodeIgniter (PHP)	Node.js + Express
Built-in ORM	Yes (Eloquent, reduces raw SQL)	No (query builder only)	No (needs separate ORM)
Built-in MVC structure	Yes, enforced	Loosely enforced	Not enforced
Task scheduling (Reminder System)	Yes, built-in Scheduler	No, needs external cron	Needs external library
Learning curve (single dev)	Moderate, well-documented	Low	Moderate–High (async)
Package ecosystem	Large (Composer)	Smaller	Large but fragmented

Table 2.2 Comparison of Backend Framework Alternatives

Laravel was selected because its built-in Task Scheduler directly supports the Smart Reminder System's requirement to run automated, occasion-based notification checks without external cron configuration (Author, Year). Its Eloquent ORM also reduces the risk of SQL injection compared to writing raw queries, addressing the security requirement identified in Chapter 3. CodeIgniter, while lighter-weight, lacks a native scheduler and requires more manual boilerplate for these recurring tasks. Node.js/Express offers strong real-time capabilities but was considered unnecessary overhead for a system that does not require live/streaming features, and its asynchronous programming model presents a steeper learning curve for a single-developer project with a fixed timeline (Section 1.6).

b. Database: MySQL vs. PostgreSQL vs. MongoDB

Criteria	**MySQL**	**PostgreSQL**	**MongoDB**
Data structure fit	Relational, strong for structured entities	Relational, stronger for complex/JSON hybrid	Document-based, flexible schema
Relationship handling (ERD Fig. 3.9)	Strong (foreign keys, joins)	Strong	Weak (manual referencing)
Native Laravel support	Excellent (default driver)	Excellent	Needs additional package
Best suited for	Transactional apps, fixed schema	Complex analytical queries	Unstructured/rapidly-changing data

Table 2.3 Comparison of Database Alternatives

The Florist Management System's data — customers, orders, order items, bouquets, categories, reminders — is inherently relational, as reflected in the ERD in Figure 3.9, where entities are linked through clearly defined one-to-many relationships. MySQL was chosen over MongoDB because the system's data does not benefit from a flexible, schema-less document structure; instead, it requires consistent relational integrity (e.g., an order must always reference a valid customer and bouquet). MySQL was chosen over PostgreSQL for practical reasons: it is the default, most widely supported database driver in Laravel hosting environments, and the system does not require PostgreSQL's advanced analytical query features, which would be unnecessary complexity for this project's scope (Author, Year).

c. Frontend: Bootstrap 5 vs. Tailwind CSS vs. Plain CSS

Criteria	Bootstrap 5	Tailwind CSS	Plain CSS
Development speed	Fast (pre-built components)	Moderate (utility classes)	Slow (everything custom)
Responsive design support	Built-in grid & breakpoints	Built-in utility breakpoints	Manual
Learning curve (limited time)	Low	Moderate	N/A
Design flexibility	Moderate (can look templated)	High	Highest but time-costly

Table 2.4 Comparison of Frontend Framework Alternatives

Bootstrap 5 was selected primarily for development speed, given the project's single-developer resourcing and fixed 7-month timeline (Section 1.6). Its pre-built responsive grid system directly satisfies the Non-Functional Requirement for responsive design across desktop and mobile devices (Section 3.1.2), without requiring the additional configuration time that Tailwind CSS's utility-first approach demands. While Tailwind offers more visual flexibility, this advantage was judged less important than shipping a functional MVP within the available timeframe.

2.4 Review of Relevant Algorithms or Architectural Patterns

a. Architectural Pattern: Model-View-Controller (MVC)

The system adopts the Model-View-Controller (MVC) architectural pattern, which is natively enforced by Laravel. MVC separates the application into three components: the Model (handles data logic and database interaction via Eloquent), the View (handles presentation, rendered with Blade templates), and the Controller (handles request logic and coordinates between Model and View). This separation of concerns is particularly relevant for a system with two distinct user roles — customer and admin — each requiring different views and controllers but sharing the same underlying data models (e.g., the Bouquet model is read by both the customer catalogue and the admin management form). MVC was preferred over a monolithic script-based structure (common in raw PHP) because it improves maintainability and testability, both of which are necessary given the project's Testing & Evaluation phase (Section 3.1).

b. Recommendation Algorithm: Rule-Based Filtering vs. Collaborative Filtering vs. Content-Based ML

Criteria	Rule-Based Filtering	Collaborative Filtering (ML)	Content-Based ML
Data requirement	None (works from day one)	Needs large historical interaction data	Needs substantial labeled data
Implementation complexity	Low	High	High
Suitability for new system	Strong fit	Poor fit (cold-start problem)	Poor fit
Explainability to user	High (clear logic)	Low (black box)	Moderate

Table 2.5 Comparison of Recommendation Approach Alternatives

The Smart Bouquet Recommendation Wizard uses a rule-based filtering approach, where customer inputs (occasion, budget, colour, style) are matched against structured bouquet attributes to produce a scored list of suggestions (as described in the recommendations → recommendation_results relationship in Figure 3.9). This approach was chosen over collaborative filtering because collaborative filtering depends on historical interaction data from many users — a "cold-start problem" that a newly launched system does not yet have (Author, Year). Content-based machine learning models similarly require a training dataset that does not yet exist for this business. A rule-based approach is therefore both practically necessary and appropriate at this stage, while remaining a system that could later be upgraded to a learning-based model once sufficient transaction data has been collected.

c. Reminder Mechanism: Scheduled Task Pattern

The Smart Reminder System is implemented using a scheduled task (cron-based) pattern, in which a recurring background process checks customer occasion dates (e.g., birthdays, anniversaries) stored in the customers table and triggers a notification when a date falls within a defined threshold. This pattern was selected over a manually-triggered or real-time push-based approach because reminders are inherently time-based rather than event-based, making a

scheduled check the natural architectural fit; Laravel's built-in Task Scheduler (compared in Section 2.3a) directly supports this without requiring a separate message-queue infrastructure.

2.5 Summary & Synthesis (The Research Gap)

The review of three existing florist systems in Section 2.2 revealed a consistent set of gaps: none of the reviewed systems (Talula Florist, Berkah Florist Cileungsi, Desflo) offer customer account-based order tracking combined with guided, preference-based bouquet selection, and none provide any form of automated occasion reminder — despite these being common pain points identified in Section 1.1. The technology stack reviewed in Section 2.3 was selected specifically to close these gaps within practical constraints: Laravel's built-in scheduler and MVC structure directly enable the reminder and dual-role (customer/admin) requirements, while MySQL's relational model supports the structured order-inventory-customer relationships the existing WhatsApp-based systems lack entirely. The architectural and algorithmic choices in Section 2.4 — MVC for maintainable separation of customer/admin concerns, and rule-based filtering for the Recommendation Wizard — were chosen because they are appropriate for a system with no existing historical data, unlike machine-learning alternatives that would be infeasible at launch.

Taken together, the literature and existing-system review confirms a clear research gap: existing florist platforms in the reviewed market segment provide either manual WhatsApp-based ordering (Talula, Berkah) or a basic e-commerce cart without guidance or retention features (Desflo), but none combine centralised order management, a guided recommendation tool, and automated customer re-engagement in a single system. The proposed Florist Management System is designed specifically to fill this gap, using a technology stack and architectural approach justified above as both technically sound and feasible within the project's single-developer, 7-month timeline.

Chapter 3

SYSTEM ANALYSIS

3.1 Introduction

The preceding chapters established both the problem context and the market gap that justify this project: Chapter 1 identified the operational challenges faced by manually run florist businesses, while Chapter 2 demonstrated, through a comparative review of three existing florist platforms, that none of them offer guided product discovery or occasion-based customer engagement. This chapter shifts the discussion from *why* the system is needed to *how* it will be systematically analysed and specified.

System analysis is the stage in which the problems and feature gaps identified earlier are translated into a structured, verifiable definition of what the system must do and how it will be built. To achieve this, several system development methodologies were considered for managing the Florist Management System's development lifecycle; the methodology selected, along with the justification for that choice, is discussed in Section 3.2. This chapter also presents an internal strengths-and-weaknesses assessment of the proposed system through a SWOT Analysis, defines the system's scope in terms of user interface, functional and non-functional requirements, and constraints and assumptions, and outlines the system models used to represent the structure and behaviour of the Florist Management System.

3.1.1 Purpose

The purpose of this chapter is to present the system analysis for the Florist Management System, translating the problems and objectives identified in Chapter 1, together with the feature gaps found in the existing systems reviewed in Chapter 2, into a concrete and verifiable specification that will guide the design work in Chapter 4. This chapter presents an internal strengths-and-weaknesses assessment of the proposed system (SWOT Analysis), the defined scope of the system (user interface, functional requirements, non-functional requirements, and constraints and assumptions), the system development process, and the system models used to represent the structure and behaviour of the system.

3.1.2 SWOT Analysis

A SWOT analysis was conducted on the proposed Florist Management System itself — rather than on a competing business — to evaluate its internal strengths and weaknesses alongside external opportunities and threats. This analysis draws on the problems identified in Chapter 1 and the comparative review of existing systems in Chapter 2 (Section 2.2) to justify why the system's two "smart" features are positioned as its key differentiators.

STRENGTHS	**WEAKNESSES**
• Two differentiating features not found in the three existing systems reviewed in Section 2.2: the Smart Bouquet Recommendation Wizard and the Smart Reminder System. • Centralised, real-time inventory tracking directly addresses the overselling/stockout problem identified in Section 1.1.2. • Built on a well-documented, widely supported stack (Laravel, MySQL, Bootstrap 5) that fits a single-developer academic timeline.	• No online payment gateway integration; payment must still be confirmed manually by the Admin, so the payment step is only partially automated. • The rule-based recommendation engine may become less accurate as the bouquet catalogue grows large, compared to a machine-learning-based approach. • Single-developer academic scope limits testing depth; no formal multi-user User Acceptance Testing (UAT) is planned.
OPPORTUNITIES	**THREATS**
• Growing digitalisation trend among SMEs in the florist/retail sector in Indonesia and	• Existing competitors reviewed in Section 2.2 (e.g., Talula Florist, Berkah Florist

Malaysia (Section 2.1) creates market readiness for adoption. • The Smart Reminder System could later be extended with WhatsApp API notifications for wider customer reach. • Recommendation Wizard usage data could eventually feed a machine-learning-based recommendation upgrade.	Cileungsi) could add similar recommendation or reminder features. • Customers' habitual reliance on WhatsApp ordering may slow adoption of a new self-service platform. • Manual payment confirmation may feel slower and less trustworthy to customers than competitors offering instant online payment.

3.1.3 Scope

The scope of the Florist Management System covers the user interface, the functional requirements, the non-functional requirements, and the constraints and assumptions under which the system is developed, as detailed in the following sub-sections.

3.1.3.1 User Interface

The Florist Management System provides two main portals:

- Customer Portal: allows customers to register and log in, browse and search the bouquet catalogue, use the Smart Bouquet Recommendation Wizard, manage their cart, check out and track orders, and submit testimonials.
- Admin Portal: enables the business owner and system administrator to manage bouquet inventory and categories, update order and payment status, manage customer records and reminders, and view the sales and customer dashboard and reports.

3.1.3.2 Functional Requirements

Table 3.1 consolidates the functional requirements of the system into a single reference list.

Table 3.1 Functional Requirements

ID	Functional Requirement	Description (Input → Process → Output)
FR-01	User Registration	Input: name, email, phone, password. Process: validate and store customer data. Output: registration success/failure message; redirect to login on success.
FR-02	User Login	Input: email, password. Process: validate credentials against stored records. Output: redirect to customer dashboard on success; error message on failure.
FR-03	Browse & Search Bouquet Catalogue	Input: category selection, search/filter keywords. Process: retrieve matching bouquet records from the database. Output: bouquet listing with images, prices, and stock availability.
FR-04	Cart Management	Input: add/update/remove cart item. Process: check stock and update cart contents. Output: updated cart summary with items and subtotal.
FR-05	Checkout & Place Order	Input: delivery details, occasion, selected cart items. Process: save order record, decrement bouquet stock. Output: order confirmation with order number.
FR-06	Use Recommendation Wizard	Input: occasion, preferred colour, budget, style, size. Process: match preferences against bouquet attributes and score results. Output: a list of recommended bouquets.

ID	Functional Requirement	Description (Input → Process → Output)
FR-07	Track / Cancel Order	Input: order number, track/cancel request. Process: read or update order status. Output: current order status or cancellation confirmation.
FR-08	Receive Reminder	Input: scheduled occasion date (from customer profile). Process: check due reminders and generate a notification. Output: reminder notification delivered to the customer.
FR-09	Submit Testimonial	Input: testimonial content, rating. Process: store testimonial pending admin approval. Output: submission confirmation.
FR-10	Manage Bouquet, Category & Stock (Admin)	Input: bouquet/category data (add, edit, delete), stock updates. Process: save changes to the bouquet and category database. Output: updated catalogue reflected on the customer side.
FR-11	Manage Order, Payment Status & Customer (Admin)	Input: order status update, payment status update, customer management action. Process: update order/payment records or customer records. Output: updated order list and customer records.
FR-12	View Dashboard & Reports (Admin)	Input: dashboard/sales/customer report request. Process: read and aggregate order, sales, and customer data. Output: dashboard summary, sales report, or customer report.

3.1.3.3 Non-Functional Requirements

Table 3.2 defines the non-functional requirements of the system with measurable, verifiable criteria, rather than general statements, so that each requirement can be tested during the testing stage (Section 3.2.4).

Table 3.2 Non-Functional Requirements

ID	Category	Measurable Criteria
NFR-01	Security	Passwords are hashed using bcrypt; role-based access control (Customer vs Admin) is enforced through Laravel middleware, so only authenticated Admin accounts can access management and dashboard routes.
NFR-02	Performance	The bouquet catalogue and admin dashboard pages must load within 3 seconds on a standard broadband connection (≥ 10 Mbps) for a catalogue of up to 200 bouquet listings.
NFR-03	Scalability	The system must support at least 50 concurrent users browsing or ordering without significant performance degradation, and the database schema must accommodate up to 5,000 order records without requiring structural change.
NFR-04	Reliability / Availability	The deployed test environment targets 99% uptime during operating hours (excluding scheduled maintenance); stock validation prevents

ID	Category	Measurable Criteria
		duplicate decrement when two customers checkout the same bouquet concurrently.
NFR-05	Usability	The interface follows a responsive Bootstrap 5 layout, verified on screen widths from 360px (mobile) to 1920px (desktop); core actions (browse → add to cart → checkout) must be completable within 3 main steps.
NFR-06	Maintainability	The system follows the MVC architectural pattern so that each module (e.g., Recommendation Wizard, Reminder System) can be updated or extended independently without modifying unrelated modules.

3.1.3.4 Constraints and Assumptions

Constraints:

- The system is accessible via web browser only; no dedicated mobile application is developed.
- No third-party online payment gateway is integrated; payment status must be confirmed manually by the Admin based on proof of payment (e.g., bank transfer receipt).
- The system is designed for a single-branch, single-admin business model; multi-branch or multi-tenant support is outside the current scope.
- A stable internet connection is required for both customer and admin access, as the system is fully web-based.

- The project is developed within a single-developer academic timeline (Section 1.6), which limits testing to functional and manual testing rather than large-scale load or performance testing.

Assumptions:

- The florist business has at least one staff member acting as Admin who is available to confirm payments and update order status in a timely manner.
- Customers possess basic digital literacy sufficient to operate a web-based ordering system without additional training.
- Bouquet stock data entered by the Admin is accurate and updated promptly, since the system relies on this data to prevent overselling.
- Email is a reliable and commonly checked communication channel for customers, as it is the medium used by the Smart Reminder System.
- A rule-based scoring approach is sufficient for the Recommendation Wizard without requiring historical data for machine learning, consistent with the literature reviewed in Section 2.4.

3.2 System Development Process

In developing the Florist Management System, several system development methodologies were considered, including the Waterfall Model, Rapid Application Development (RAD), and Agile Methodology. After evaluating the nature of this project — which involves multiple interdependent modules such as customer ordering, bouquet inventory management, the Smart Bouquet Recommendation Wizard, and the Smart Reminder System — Agile Methodology was selected as the most suitable approach.

Agile was chosen because it supports iterative development, allowing each module to be built, tested, and refined independently before full integration, rather than requiring the entire system to be specified upfront. This is particularly useful for the two “smart” features of this project, which may need several rounds of refinement before they behave as intended, and for a single-developer academic timeline where minor requirement changes are expected as development progresses.

The system development process for the Florist Management System follows the Agile cycle of planning, design, development, testing, deployment, and maintenance, repeated across short iterations (sprints). Each sprint delivers one functional component of the system — for example, one sprint may focus solely on customer registration and login, while another focuses on bouquet inventory management. This iterative structure was chosen over a single-pass Waterfall approach because it allows problems to be identified early: if the Smart Bouquet Recommendation Wizard's filtering logic does not produce useful suggestions during testing, it can be revised in the next sprint without reworking the entire system. Agile also supports the phased plan already set out in the project timeline (Section 1.6), where feature modules are developed in overlapping stages rather than strictly one after another.

Development is organised into the following planned builds:

- Build 1 — Core Platform: Customer and admin authentication, bouquet and category management
- Build 2 — Transaction Features: Cart management, checkout, order placement, order and payment status tracking
- Build 3 — Smart Features: Smart Bouquet Recommendation Wizard, Smart Reminder System
- Build 4 — Admin Insights: Admin dashboard, sales report, customer report, testimonial approval

Each build is reviewed against its functional requirements before the next begins, ensuring that foundational modules — such as the bouquet catalogue — are stable before dependent features, such as the recommendation engine that reads from that catalogue, are developed. The following sub-sections describe the six stages of this process in detail.

3.2.1 Requirement Gathering

Requirements were gathered through a structured review of existing florist systems (Chapter 2) and analysis of manual florist operations, rather than through formal end-user interviews, given the single-developer academic scope of this project. This technique was chosen because reviewing live, comparable systems provided concrete, verifiable feature gaps (e.g., the absence

of recommendation or reminder tools) that directly justified the system's two "smart" features, grounding requirements in evidence rather than assumption. The detailed outcome of this stage is presented in Section 3.1.3 (Scope).

3.2.2 System Design

A Use Case Diagram, Context Diagram, DFD Levels 0–1, and an Entity Relationship Diagram (ERD) were used to model the system at the analysis level (Section 3.3). These techniques were selected specifically because the system has two distinct user roles (Customer and Admin) with largely separate workflows — the Use Case and Context Diagrams establish who interacts with the system and what they can do, while the DFDs trace how data such as order details, bouquet stock, and reminder schedules move between processes and data stores. The ERD was developed last, once data flow was clear, to finalise the relational structure linking customers, orders, bouquets, and reminders. UI mockups were also designed separately for the customer-facing catalogue/checkout flow and the admin dashboard, reflecting the fact that customers need a browsing-and-purchasing experience while admins need a data-management experience; the detailed design-level models and design forms are presented in Chapter 4.

3.2.3 Implementation

The system is implemented using PHP Laravel as the backend framework, MySQL as the database, and Bootstrap 5 for the frontend, following the MVC (Model-View-Controller) architectural pattern. This approach was chosen specifically because MVC separates the Recommendation Wizard's filtering logic (Controller) from the underlying bouquet data (Model) and the customer-facing question flow (View), allowing the recommendation rules to be adjusted independently without touching how bouquet data is stored or displayed. Laravel's built-in task scheduler is used as the core mechanism behind the Smart Reminder System, allowing reminder emails to be triggered automatically on a defined schedule rather than requiring manual admin action.

3.2.4 Testing

Manual functional testing is performed on each module individually as it is completed (e.g., testing the Recommendation Wizard's scoring logic against sample preference inputs), followed by integration testing once modules are combined, to confirm that data created in one module (e.g., an order) is correctly reflected in dependent modules (e.g., the admin dashboard's sales report).

3.2.5 Deployment

The system is deployed to a local/test server for cross-browser and cross-device verification prior to final submission, ensuring the responsive Bootstrap layout behaves consistently across common screen sizes.

3.2.6 Maintenance

After deployment, the system enters a maintenance phase covering corrective maintenance — fixing bugs discovered after submission or during the project demonstration — and minor perfective maintenance, such as adjusting the Recommendation Wizard's scoring weights or refining the Reminder System's email templates based on feedback received during evaluation. Because this is a single-developer academic project, formal long-term maintenance (e.g., service-level-agreement-based support) is outside the scope of this proposal. However, the modular MVC architecture described in Section 3.2.3 is designed so that future enhancements — such as adding an online payment gateway, which is currently outside the system scope (Section 3.1.3) — can be incorporated without major rework of the existing modules.

3.3 System Modeling

The system modelling process is conducted to provide a comprehensive visual representation of the proposed **Web-Based Florist Management System**. These models are developed to illustrate the overall system architecture, user interactions, business processes, data relationships, and navigation flow before the implementation stage begins. By modelling the system in advance, both the functional and non-functional requirements identified during the system analysis phase can be translated into a structured and well-organised system design.

The system models developed for the proposed Florist Management System include:

- Use Case Diagram
- Context Diagram (DFD Level 0)
- Data Flow Diagram (DFD Level 1)
- System Flowcharts (Customer & Admin)

- Entity Relationship Diagram (ERD)
- Site Map
- Screen Flow

These modelling techniques provide a clear blueprint for the development of the system by describing how customers and administrators interact with the application, how information flows throughout the system, and how the database entities are related. Furthermore, the models serve as a reference throughout the implementation, testing, and maintenance phases, ensuring that the developed system fulfils the project objectives and functional requirements defined in the earlier chapters.

CHAPTER 4

SYSTEM DESIGN

4.1 Introduction

The Florist Management System is a web-based florist ordering and management platform designed to simplify how customers browse, purchase, and track bouquet orders, while giving the business owner centralised control over inventory and sales. The system includes several essential forms that form the core of the user interaction process, from registration and login to bouquet browsing, guided recommendations, checkout, and admin-side order management. Each form is designed with a simple and intuitive interface, ensuring ease of use for both first-time and repeat customers.

The registration and login forms serve as the initial gateway for users to access the system. The registration form contains fields such as full name, email address, phone number, password, and date of birth, while the login form requires only an email address and password. After successfully logging in, customers can access the bouquet catalogue, where they may browse by category or use the Smart Bouquet Recommendation Wizard to receive guided suggestions based on occasion, budget, and colour preference. Selected bouquets are automatically saved in the cart and carried forward to checkout, where customers enter delivery details and complete their order.

Furthermore, the Florist Management System also provides a dedicated admin form responsible for managing bouquet inventory, order and payment status, and customer records. This admin form includes more complex features such as adding or editing bouquet listings, monitoring stock levels, and viewing sales and customer reports through a centralised dashboard. With this complete system structure, the Florist Management System is able to provide a convenient, guided, and efficient bouquet ordering experience, both for customers and the business owner.

Chapter 4 presents the detailed system design for the web-based **Florist Management System**. While system analysis (Chapter 3) focused on identifying requirements and business process workflows, this chapter translates those analytical requirements into concrete software design specifications.

Purpose: The purpose of this design phase is to provide a technical blueprint for the system's architecture, structural database relationships, behavioral interactions, and front-end interface layouts. This ensures that the system components—such as the Smart Bouquet

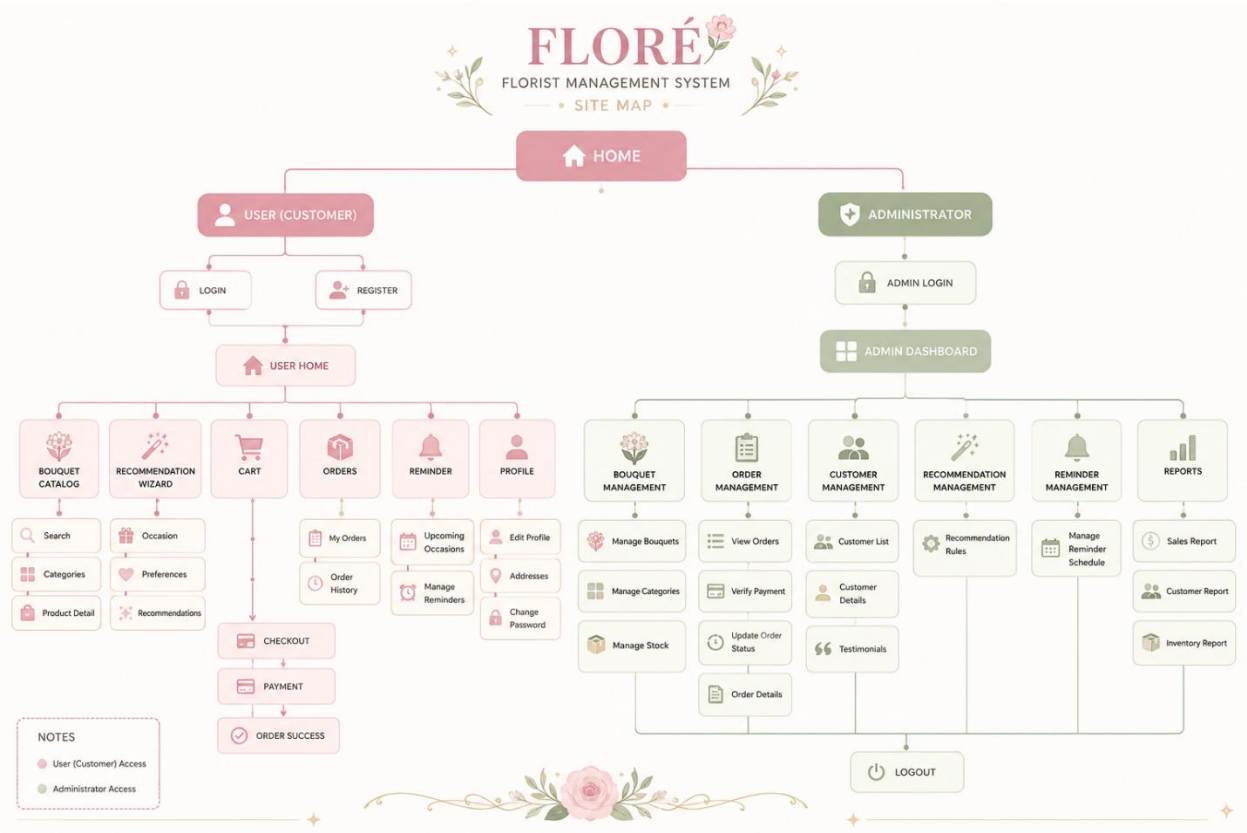

Recommendation Wizard, Smart Reminder System, and Admin Management Dashboard—are seamlessly integrated before full implementation.

Scope: The design scope encompasses structural and behavioural UML modelling — Use Case, Sequence, Activity, State Machine, Class, Component, and Deployment Diagrams — as well as web site mapping and user interface screen flows/wireframes covering both the Customer and Admin portals.

4.2 Design Forms and Report

4.2.1 Site Map

The Site Map defines the overall navigational hierarchy and structural organization of the Florist Management System web application. It illustrates how pages are connected across the public front-end customer portal and the restricted back-end admin dashboard.

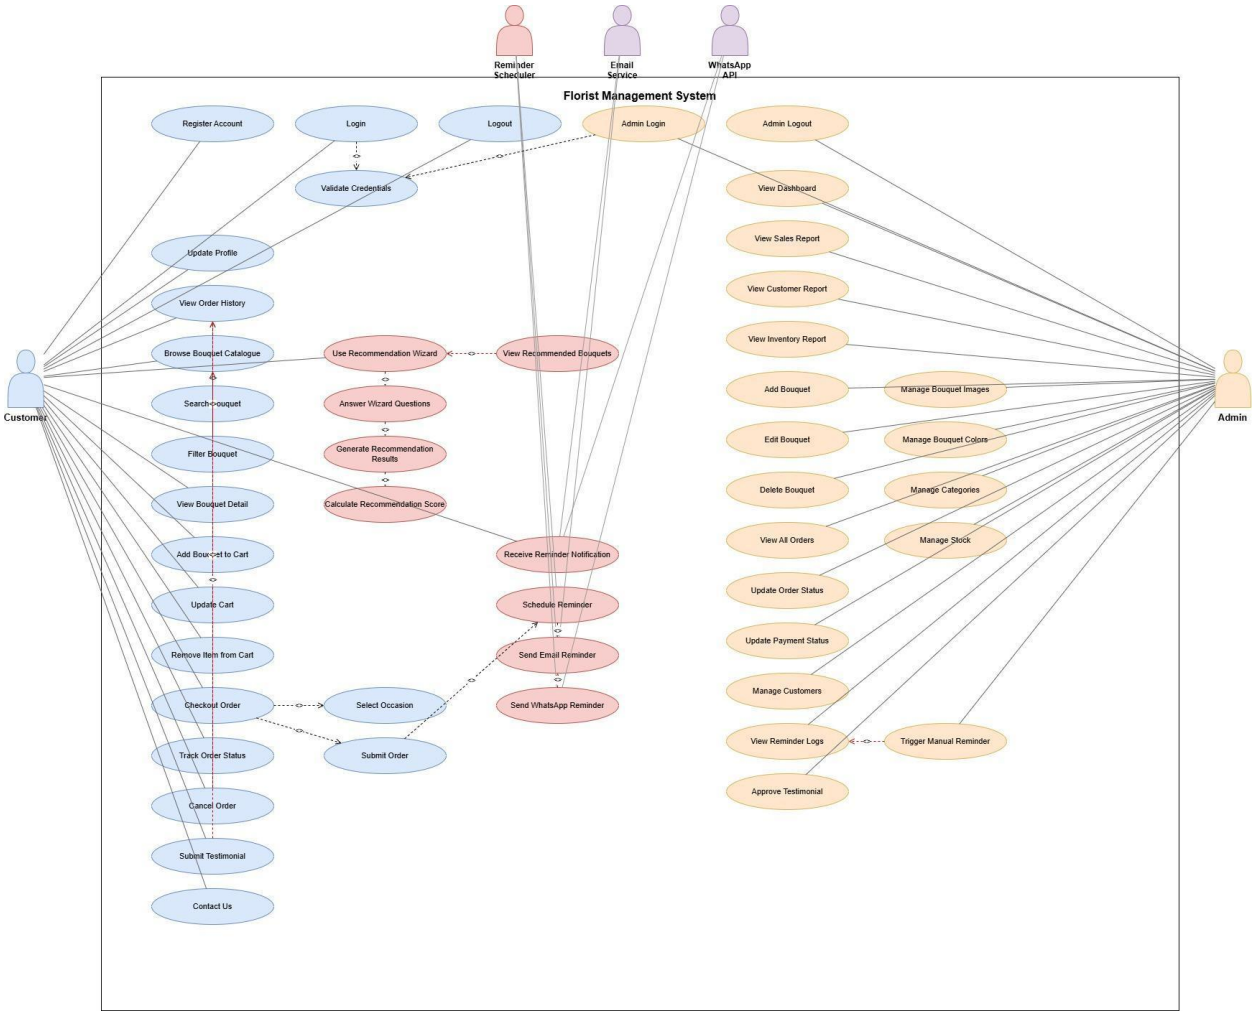

4.2.2 UML Diagrams

Unified Modeling Language (UML) diagrams are used to model the static structure and dynamic behavioral aspects of the system.

4.2.2.1 Use Case Diagram

The Use Case Diagram defines the functional scope of the application by illustrating interactions between primary actors (**Customer**, **Admin**) and external support actors (**Reminder Scheduler**, **Email Service/WhatsApp API**).

- **Diagram Reference:**

- *Figure 4.2 USE CASE DIAGRAM*

Figure 4.2 presents the Use Case Diagram of the Florist Management System, showing the two primary actors — **Customer** and **Admin** — along with two supporting external actors, the

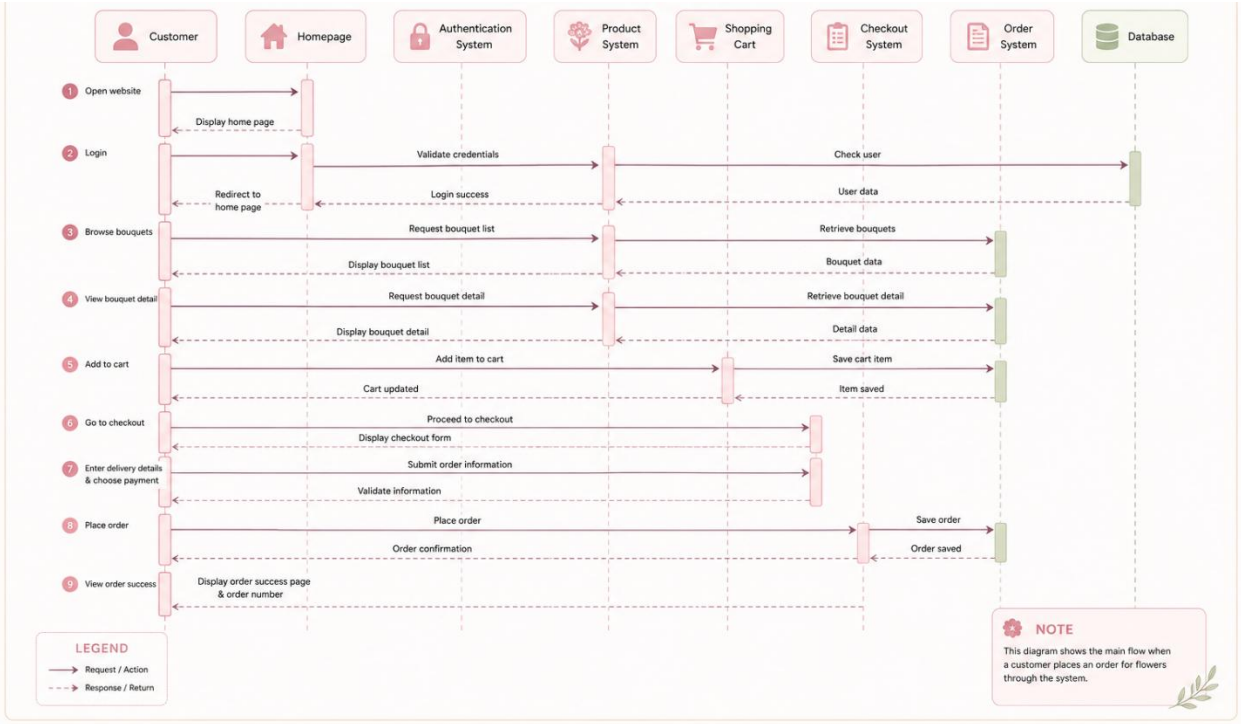

Reminder Scheduler and the **Email Service/WhatsApp API**, which the system relies on to deliver notifications. The Customer's use cases include Register Account, Login, Browse Bouquet Catalogue, Search Bouquet, Filter Bouquet, Add Bouquet to Cart, Checkout Order, Use Recommendation Wizard, Track Order Status, Cancel Order, and Submit Testimonial. The Admin's use cases include Manage Bouquet, Manage Categories, Manage Stock, View All Orders, Update Order Status, Manage Customers, and View Sales/Customer/Inventory Reports. Several relationships use <<include>>, such as Checkout Order always including Validate Credentials, and <<extend>>, such as Use Recommendation Wizard optionally extending into Generate Recommendation Results.

Description: Customers interact with use cases such as *Register Account, Browse Catalogue, Use Recommendation Wizard, Add to Cart, Checkout Order, Track Order*, and *Submit Testimonial*. Admins interact with use cases like *Manage Bouquet, Manage Categories, Manage Stock, Update Order Status*, and *View Sales/Customer Reports*. Included (<<include>>) relationships enforce authentication during checkout, while extended (<<extend>>) relationships link the wizard to recommendation results.

4.2.2.2 Sequence Diagram

The Sequence Diagram models the chronological, step-by-step messaging and object interactions during key system transactions, such as the customer checkout and recommendation execution flows.

- **Diagram Reference:**

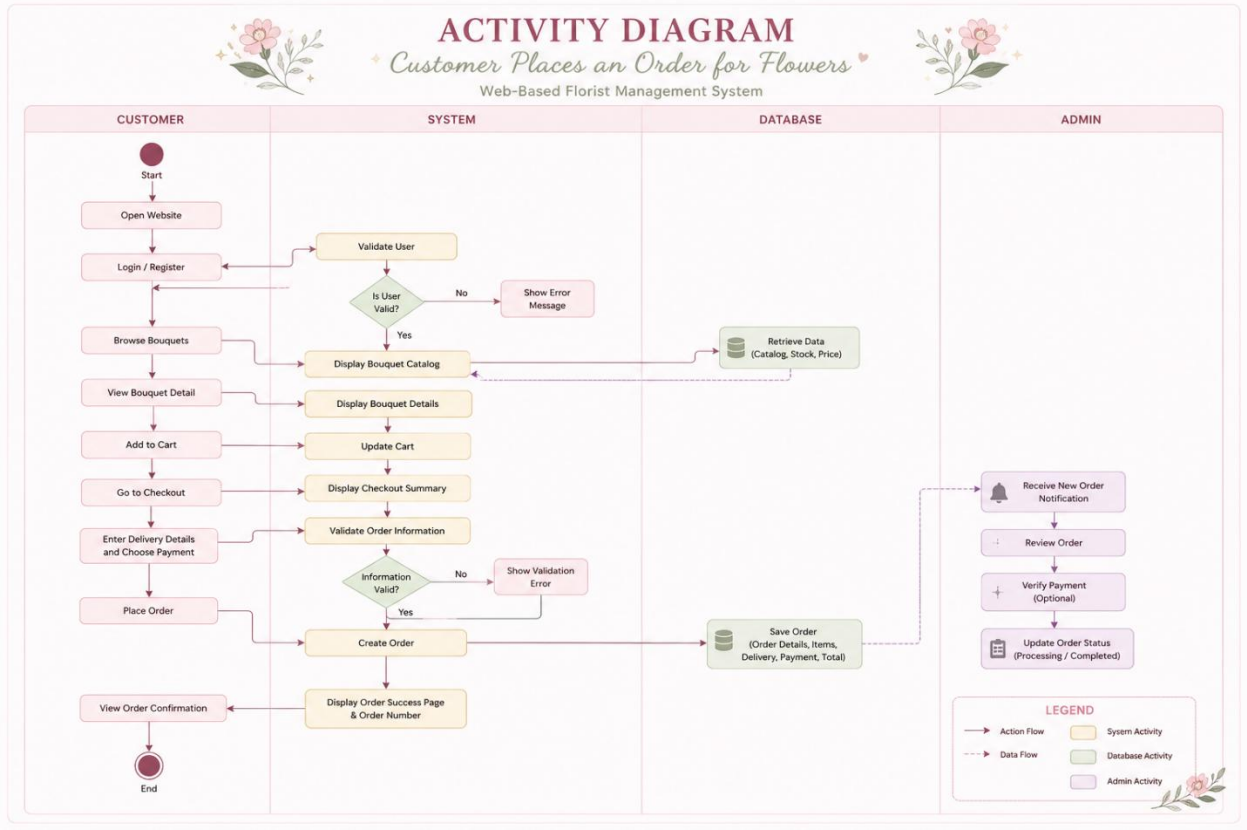

Description: Illustrates how the Customer sends input data through the UI / Order Interface, which passes requests to the Order Controller, validates stock with the Bouquet Model, saves order records in the MySQL Database, and returns an order confirmation response.

4.2.2.3 Activity Diagram

The Activity Diagram maps out the operational workflow and decision logic within system processes, including parallel actions and conditional branches.

- **Diagram Reference:**

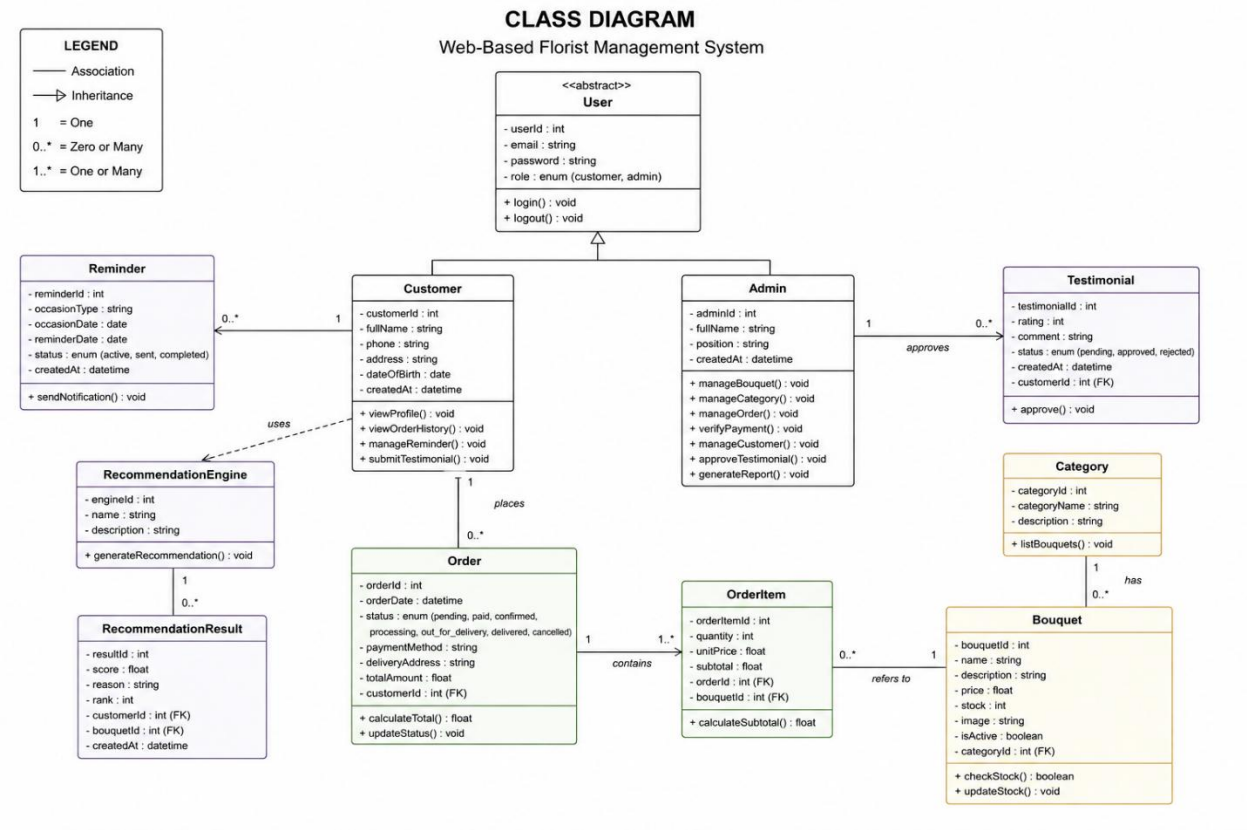

Description: Represents the workflow from the moment a user initiates a task (e.g., answering preference questions in the Smart Recommendation Wizard). It displays logic branches (e.g., verifying stock levels or checking if payment proof is uploaded) and parallel paths (e.g., saving order data while triggering an occasion reminder notification).

4.2.2.4 Class Diagram

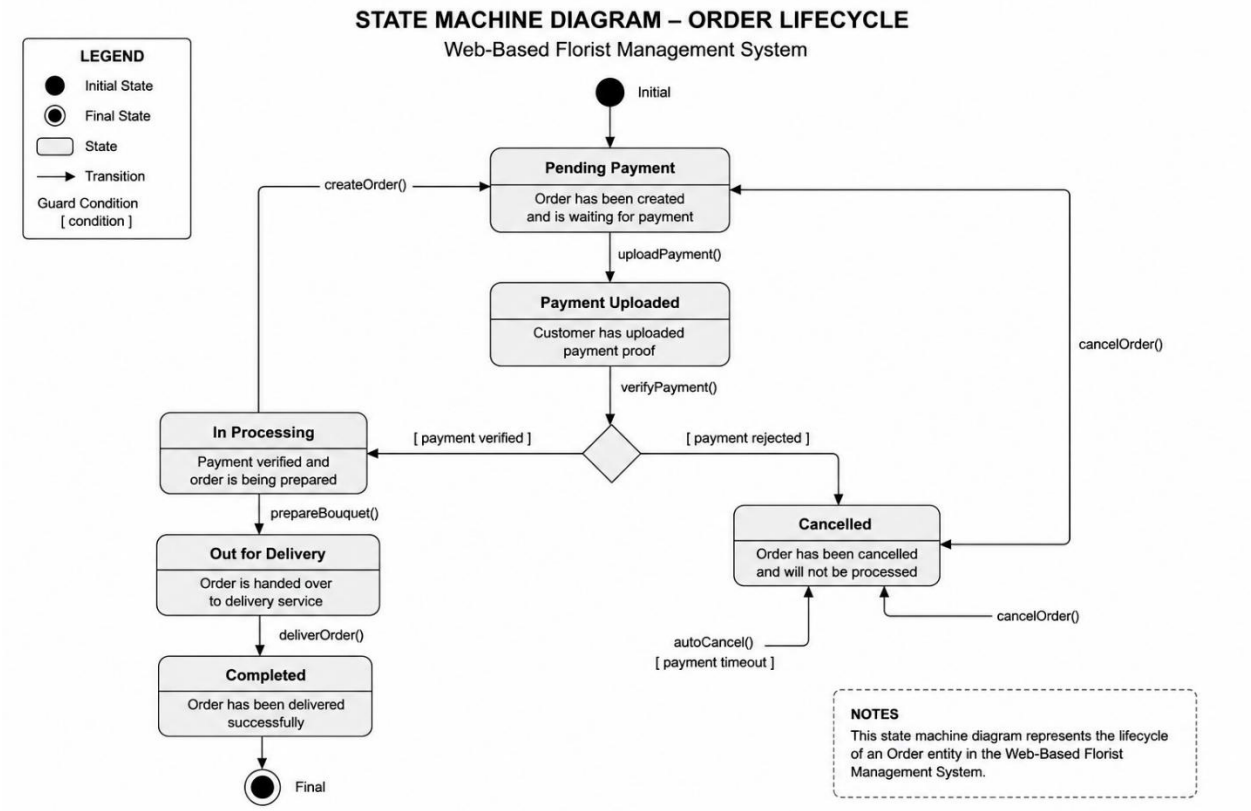

The Class Diagram forms the structural blueprint of the system's data model, detailing object classes, attributes, methods/operations, and relationship multiplicities.

- **Diagram Reference:**

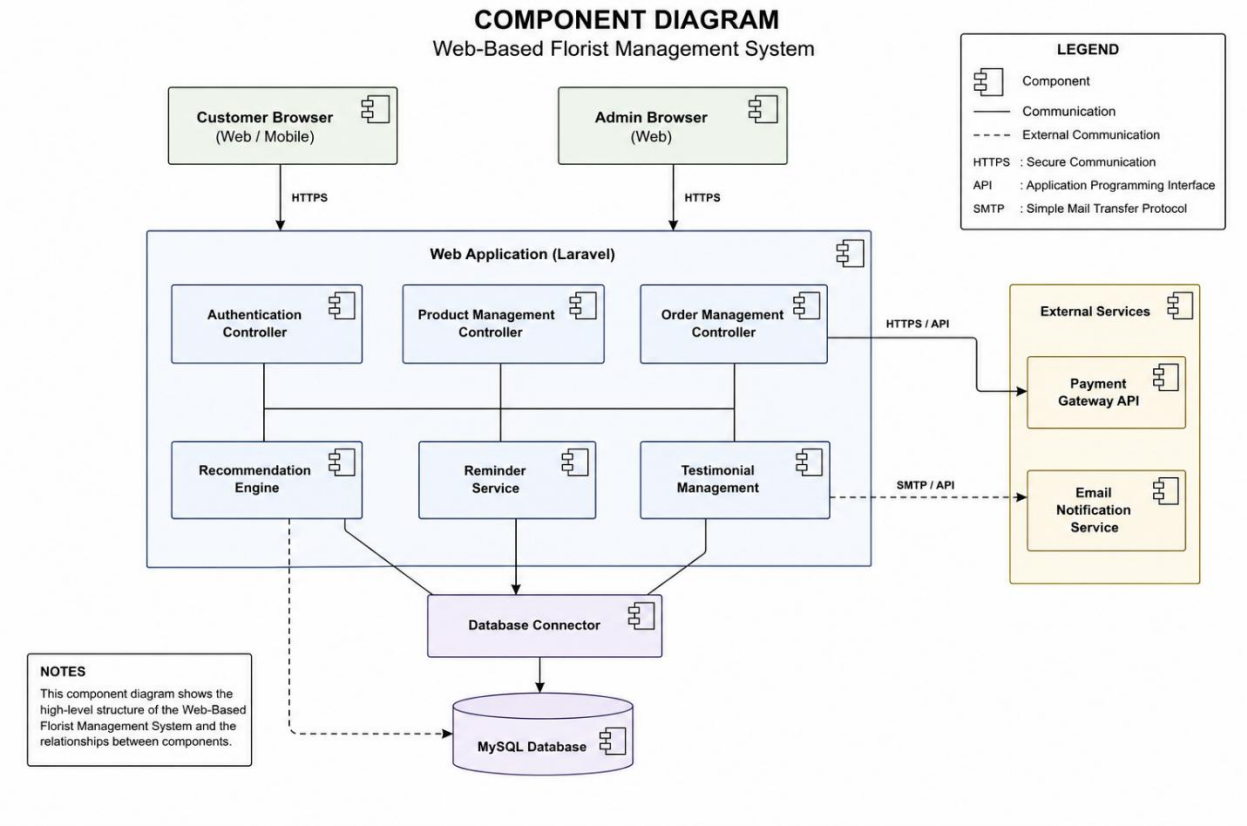

Description: Captures domain entities including User, Customer, Admin, Bouquet, Category, Order, OrderItem, Payment, Recommendation, and Reminder. Multiplicities depict that a Customer can place multiple (1..*) Orders, while each Order contains one **or more OrderItems linked to specific Bouquets.**

4.2.2.5 State Machine Diagram

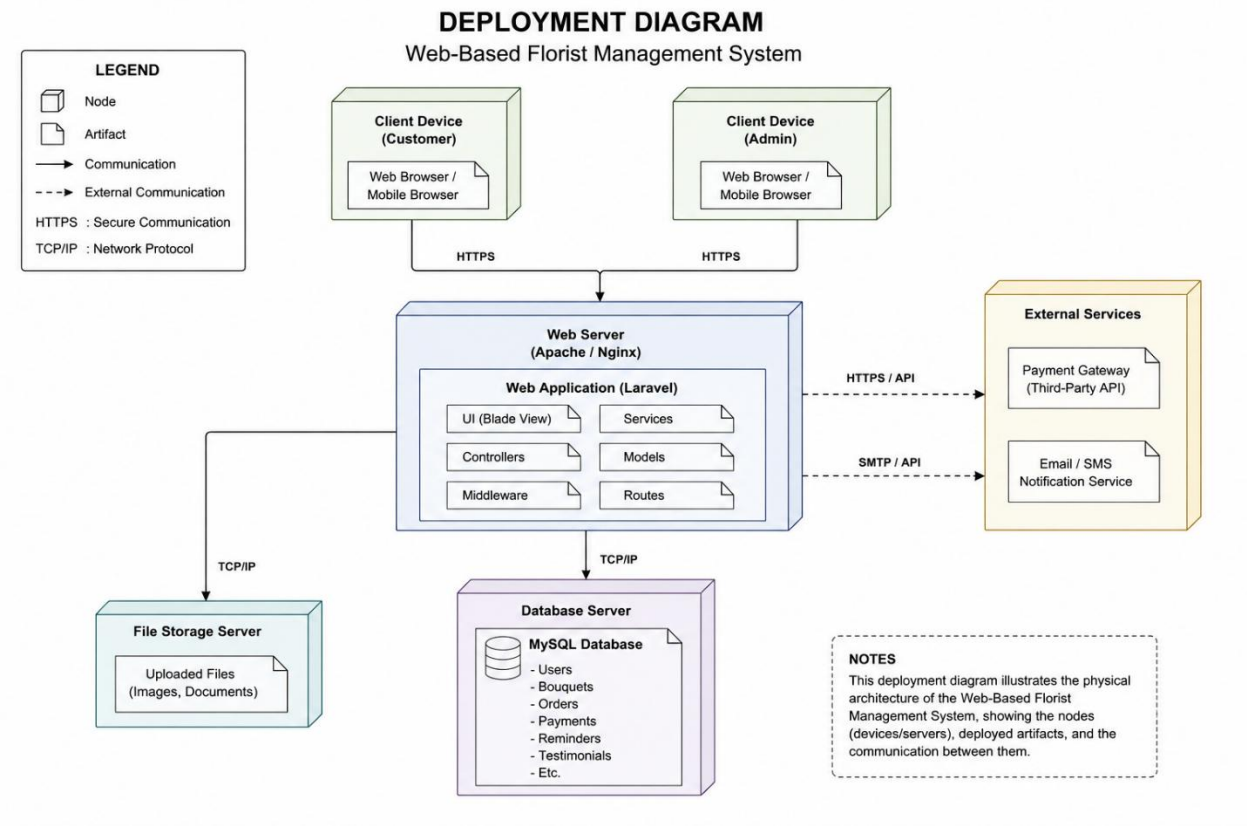

Description: Illustrates the dynamic lifecycle and valid state transitions of the system's core entities. Specifically, it tracks an **Order** object as it transitions through the following states: **Created**, when the customer first submits a checkout request; **Pending Payment**, while the system awaits proof of payment from the customer; **Payment Confirmed**, once the Admin has verified the submitted payment; **Preparing**, during which the bouquet is assembled by the florist; **Out for Delivery**, once the order leaves for the customer's delivery address; and finally **Delivered**, marking successful completion of the order. An order in the Pending Payment state may also transition directly to **Cancelled** if payment is not verified within the expected timeframe or if the customer cancels the request, preventing an unconfirmed order from proceeding further into the fulfilment process. It also models the lifecycle of customizable bouquet items and payment status verifications.

4.2.2.6 Component Diagram

Description: High-level view of the structural organization of software components (UI Component, Authentication Controller, Recommendation Engine, Database Connector, External Payment/Messaging Gateway).

4.2.2.7 Deployment Diagram

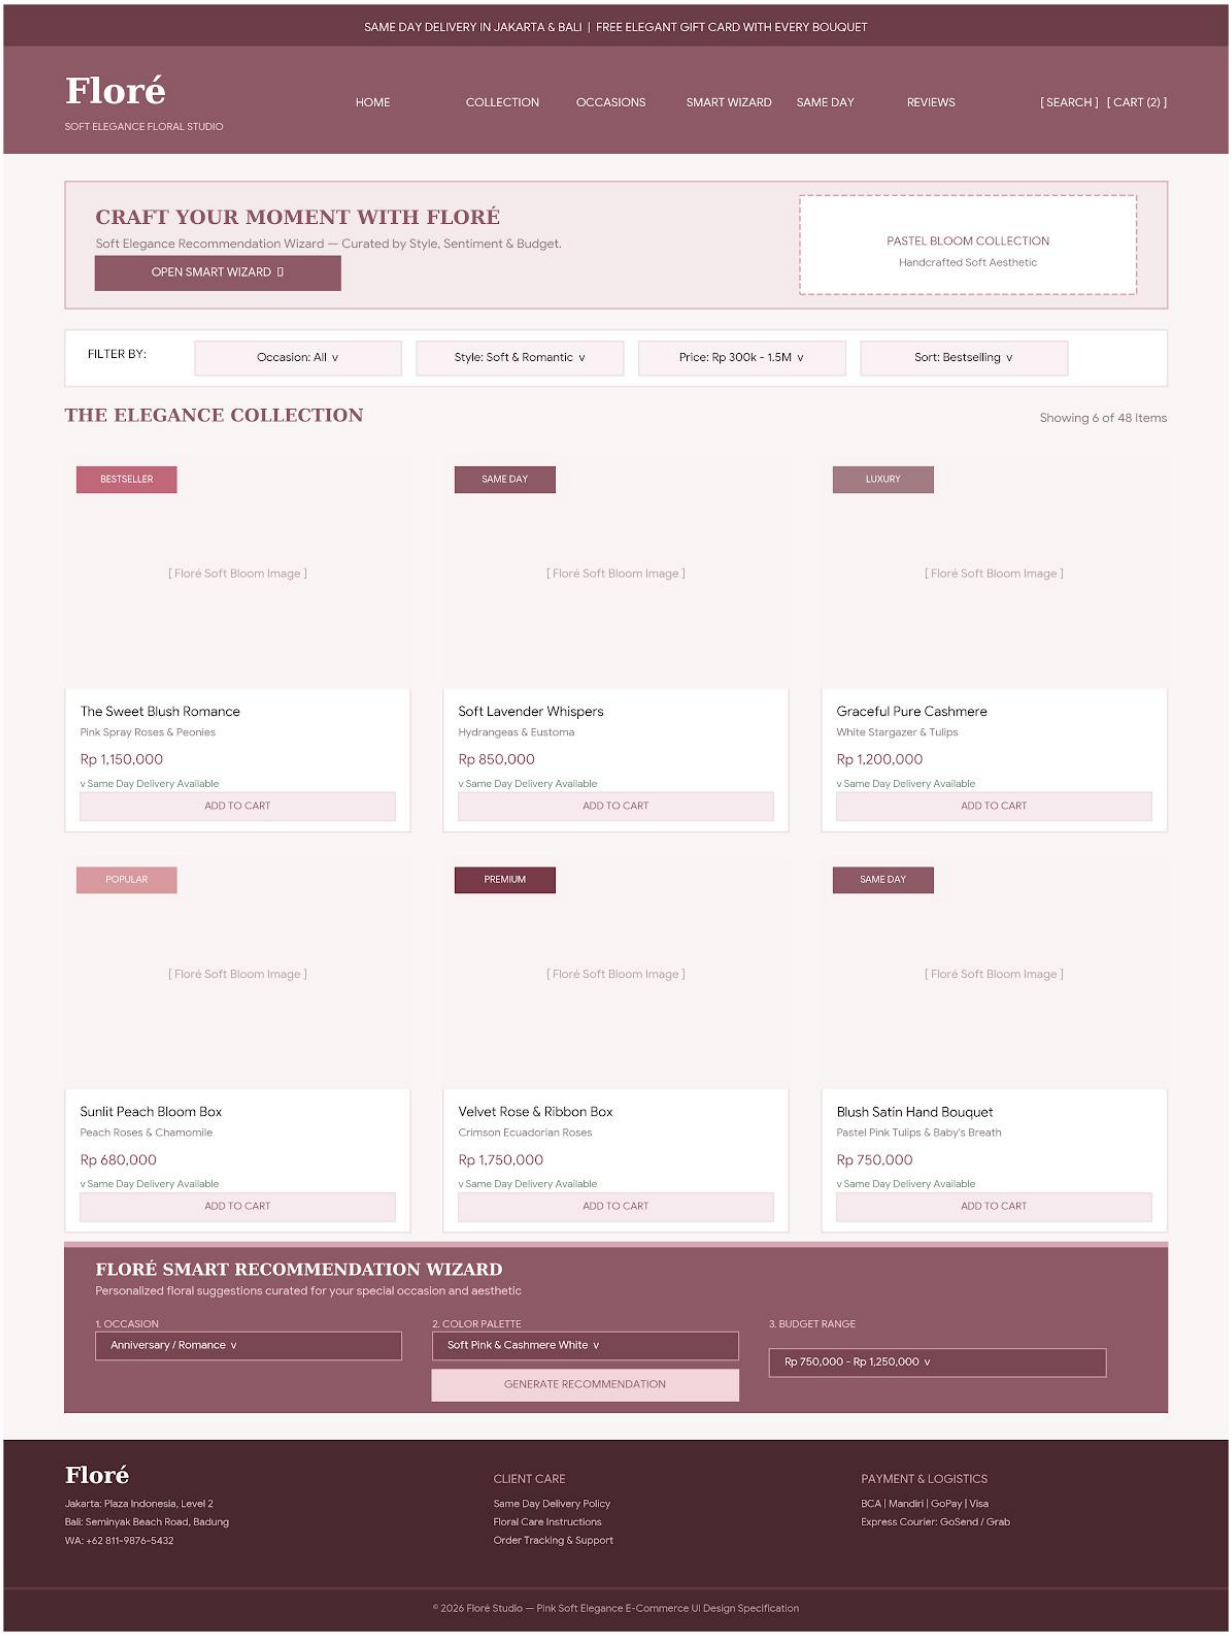

Description: Maps out the physical execution environment, showing how web application components, database servers (MySQL), and client browsers interact over network protocols (HTTPS/APIs).

4.2.2.8 ERD

4.2.2.9 CONTEXT DIAGRAM

4.2.3 Screen Flow / User Interface

The User Interface (UI) design outlines the visual wireframes, screen flow, and form layouts for both the Customer and Admin interfaces.

OUR STORY & PHILOSOPHY

Mewujudkan Perasaan Melalui Seni Merangkai Bunga Artisanal

[Image: Floré Workshop]

PROFIL BRAND FLORÉ STUDIO

Berdiri sejak 2021, Floré Studio percaya bahwa setiap tangkai bunga memiliki bahasa emosi tersendiri. Kami menggabungkan estetika florist Eropa kuno dengan sentuhan modern minimalis untuk menciptakan rangkaian yang puitis dan bermakna.

FILOSOFI DESAIN BUNGA KAMI

Artisanal Composition

Rangkaian asimetris alami yang menonjolkan bentuk bunga.

Eco-Conscious Sourcing

100% bunga dipetik dari petani lokal organik bersertifikat.

Emotional Storytelling

Setiap warna dan tekstur dirancang sesuai pesan emosional Anda.

MEET OUR LEAD FLORIST

Master Florist

Elena Rostova — Lead Floral Designer

Lulusan Floral Art Academy, London (10+ Tahun Pengalaman)

Elena memadukan teknik botanis klasik Eropa dengan tren kontemporer. Bagi Elena, merangkai bunga bukan sekadar menata warna, melainkan menyusun simfoni visual yang menghidupkan kembali kenangan indah setiap pelanggan.

"Rangkaian Floré Studio selalu punya jiwa. Bunga-bunganya tidak hanya segar, tapi komposisinya sangat artistik dan bertahan lebih dari seminggu!"

— Clara Sinta, VIP Customer

FLOWER CARE GUIDE

Panduan Merawat Bunga Potong Agar Segar & Tahan Lama Hingga 10 Hari

4 LANGKAH MUDAH PERAWATAN BUNGA POTONG

1

1. Potong Batang 45°

Potong bagian bawah batang sepanjang 2 cm secara miring dengan pisau tajam setiap 2 hari agar penyerapan air maksimal.

2

2. Gunakan Air Bersih

Gunakan vas yang sangat bersih dan isi dengan air dingin/suhu ruangan. Tambahkan Flower Food yang kami sediakan.

3

3. Bersihkan Daun Bawah

Buang semua daun yang terendam air vas untuk mencegah pertumbuhan bakteri yang mempercepat pembusukan.

4

4. Hindari Sinar Langsung

Letakkan vas di area sejuk. Hindari terkena sinar matahari langsung, paparan AC berlebih, atau buah-buahan matang.

TIPS KHUSUS BERDASARKAN JENIS BUNGA

JENIS BUNGA	ESTIMASI KETAHANAN	TRIK KHUSUS PERAWATAN
Mawar (Rose)	7 - 10 Hari	Buang kelopak luar yang layu; potong batang di bawah air.
Peony	5 - 7 Hari	Bantu mekarkan dengan membilas kuncup dengan air hangat.
Lily	10 - 14 Hari	Petik serbuk sari (anther) kuning agar tidak mengotori kelopak.
Hydrangea	4 - 7 Hari	Semprotkan air halus pada kepala bunga jika mulai layu.

FAQ & SHIPPING POLICY

Informasi Jangkauan Pengiriman, Toleransi Keterlambatan, dan Garansi Kesegaran

1. JANGKAUAN AREA & METODE PENGIRIMAN

 Area Jangkauan Courier Instant & Dedicated

- Courier Instant (Jabodetabek): Pengiriman 2-3 jam sampai menggunakan armada berpendingin khusus Floré.
- Same-Day Delivery: Slot waktu kedatangan dapat dipilih (09.00 - 12.00 / 13.00 - 17.00 / 18.00 - 21.00).
- Pengiriman Luar Kota: Khusus bunga kering (Dried/Preserved Flowers) menggunakan pengiriman kargo express dengan proteksi peti kayu.

2. KEBIJAKAN KETERLAMBATAN & GARANSI KERUSAKAN

Q: Berapa toleransi keterlambatan pengiriman?

Floré Studio memberikan toleransi keterlambatan maksimal 45 menit dari slot waktu yang disepakati akibat faktor cuaca buruk atau kemacetan ekstrem. Jika pesanan terlambat lebih dari 45 menit, pelanggan berhak menerima Voucher Diskon 20% untuk pembelian berikutnya.

Q: Bagaimana jika bunga rusak atau layu saat diterima?

Kami memberikan Garansi 100% Replacement (Ganti Bunga Baru) jika rangkaian diterima dalam kondisi layu berat, batang patah, atau rusak saat pengiriman oleh kurir kami.

Q: Apa syarat dan prosedur pengajuan klaim garansi?

1. Wajib mengirimkan foto & video unboxing maksimal 3 jam setelah paket diterima.
2. Hubungi Customer Support via WhatsApp Admin dengan menyertakan Nomor Transaksi.
3. Rangkaian pengganti akan dikirim gratis di hari yang sama atau di-refund 100%.

Masih Memiliki Pertanyaan Lain?
